Steps to invoke MultiConfig Job manually for all error out models:

Load CTO API tester with the below url:

Services to be invoked at CTO end:

API tester url:

http://g1t7196.austin.hpicorp.net:9080/smcfs/yfshttpapi/yantrahttpapitester.jsp

Or

http://g2t5179.austin.hpicorp.net:9080/smcfs/yfshttpapi/yantrahttpapitester.jsp

Service 1: To load all possible combination in CTO database

**Service Name:** HPSEMMultiConfigCTOService

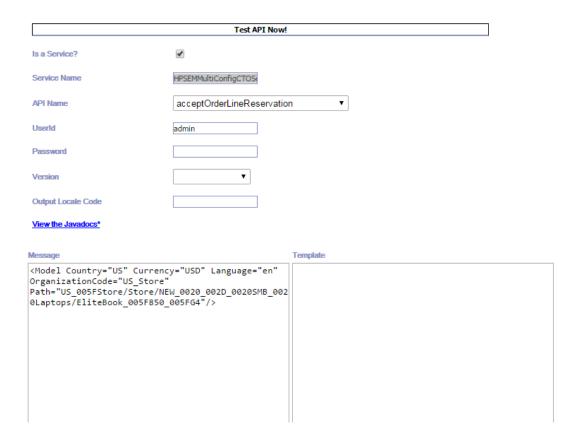

Input: [varies based on model]

<Model Country="US" Currency="USD" Language="en" OrganizationCode="US\_Store" Path="US\_005FStore/Sandbox/QA/Laptops/D9S33AV"/>

- ➤ Click "Test API Now" after giving input
- > Response will be as below
  - <?xml version="1.0" encoding="UTF-8"?>
  - <APiMultiConfig Message="324 Valid configuration found for this model"/>

[no of combination varies based on model]

## IBM(R) Sterling HTTP API Tester

Service 2: To process the combination to update price and catalog [Invoke it only once after invoking 1<sup>st</sup> service for all the models]

Service Name: HPItemPriceCTOService

## Input:

<Model Country="US" Currency="USD" Language="en" OrganizationCode="US\_Store"
Path="US\_005FStore/Sandbox/QA/Laptops/D9S33AV"/>

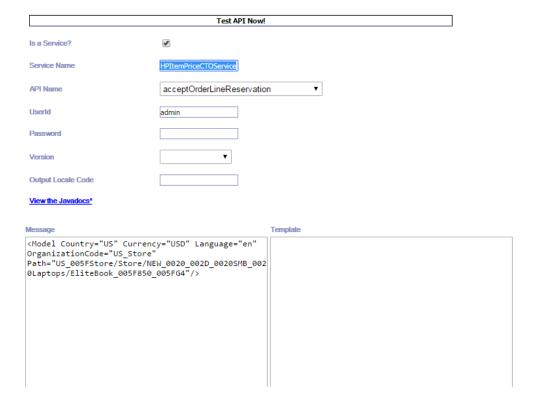

Click "Test API Now" after giving input

> It will end with the below response.

<ApiSuccess/>

## IBM(R) Sterling HTTP API Tester

## Note:

- > Don't do parallel invocation. Models needs to be processed one after the another.
- Ensure there is no results for the below query in CTO database at the end before proceeding with Lowest price job.

Select \* from hp\_sem\_multiconfig where total\_price is null.
